

## Voice APIs

Extend your solution

### Meet more customer requirements

The SkySwitch platform is designed to deliver all the communications capabilities that your customers need. But sometimes you might have a particular requirement that's not built into the solution. Your software developers can use our Voice APIs to gain access to the underlying systems that power the PBX portal and the Telco portal to easily extend the solution to meet those specific needs.

### Flexibility

You can use the APIs to:

- › Subscribe to real-time call data to build your own dashboards or alert on potentially interesting call flows.
- › Add provisioning functionality to your own internal systems to streamline onboarding workflows.
- › Manage DID inventory.
- › Manage E911 locations.
- › Integrate click-to-call into your own applications.

These are just a few examples. SkySwitch APIs are built to allow you to do anything that can be done in the PBX and Telco portals programmatically within your own application.

### Fully documented

These are REST APIs so they are programming language-agnostic. And they are fully documented at [developers.skyswitch.com](https://developers.skyswitch.com), using industry standards, making it easy to take full advantage of all available extension opportunities.
